

Hotel Advisor

You are in the 2000 year. The Internet is very poor developed. There are no booking and social services. And you have a great idea... You should develop a prototype of the application, where users can add a hotels which they have visited and put a rating for them.

Lets start with this simple workflow

1. As a user I can register. As a user I can sign in.
2. As a user I can see a list of hotels.
3. As a user I can add a hotel. Hotel has next attributes:
 - a. title(required)
 - b. star rating(required)
 - c. breakfast included?
 - d. room description
 - e. photo
 - f. price for room
 - g. address(different object) - country, state, city, street
4. As a user on hotel details page I can rate a hotel from 1 to 5 with comment.
5. On the landing page display top 5 hotels with the best rating.

Recommended technologies

If you know your way, skip this step.

Otherwise we are expecting from you to use these gems in project - devise, twitter bootstrap, haml, simple_form, carriervawe, rspec, capybara

General recommendations

- Keep your code clean.
- Thin controllers, fat models.
- Don't forget about validations
- Tests
- Don't hesitate to ask questions if you got troubles

The final code you should push to github and send us a link to the repo. Good luck and looking forward to see a finished project.
